

Lakeland Mycology Club LMC a NAMA affiliated Society

Membership Meeting December 9, 1974

We were unable to obtain a quorum and therefore we were unable to enact any official business. All members are requested to mark <u>January 12, 1975</u> on their calendars and attend the next scheduled meeting. We again remind all of our members that we will meet the second Sunday of each month at the Outdoor Education Center, 247 Southern Blvd., Chatham, N.J. at 1:00 P.M. (See November Newsletter for map)

In accordance with our constitution, if a member cannot attend a meeting when a quorum is required, such member may foreward a written proxy to any other active member in good standing. Your proxy is solicitated if you are unable to attend since the following matters must be resolved. (Form attached)

Election of Officers

The following slate of members were nominated by the nominating committee, Mr. Stan Tyler Chairman.

For:

President Vice President Secretary

Membership/Treasurer

Mr. Victor Gambino Mrs. Candace Wiser Mrs. Irene Tyler

Mrs. Margarete Turchick

Other nominations are welcome.

NAMA Affiliation/Association

As our members know, and our letterhead points out, LMC has been an affiliated society with NAMA, a national association of amateur mycology societies. Recently NAMA revised its rulings as to what are affiliated and associated societies and in our last issue we reproduced the revised rules.

It is the feeling of the executive committee that under these rules LMC can no longer be affiliated with NAMA. It is felt that mandatory membership in NAMA of all our members is an imposition which will seriously affect our club and its future.

The executive committee was tempted to severe its ties with NAMA entirely, but decided to reluctantly accept association status, and to protest the change in ruling. Members are requested to affirm this decision.

Change in Club Name

In 1971 when this organization was formed, it was considered to be a local club and obtained its name from a local area of Northern New Jersey surrounding Lake Hopatcong called by its residents "Lakeland". This name has caused confusion, as there are many areas of New Jersey and New York called "Lakeland" and others think of it as a name of a city, and it does not really identify the locality of our club.

Our Society can no longer be called a local club. Our membership stretches across New Jersey and our club is the only Mycological Association in the State.

The executive committee recommends that the name of our organization be changed to be the New Jersey Mycological Association (NJMA) and that we explore incorporating as a non-profit educational organization under the Laws of New Jersey.

Mini-Course in Mushroom Identification

We are pleased to announce that we will devote the major portion of our winter meetings to a mini course in mushroom identification. The course will run from January to April and will be on the second Sunday of each month.

The instructor will be Col. Stanley Tyler, chairman of our Education Committee.

If you are interested in attending these classes please indicate so on the enclosed proxy. There is no charge for this identification course.

Forays

We also would like to know how many members would be interested in a two or three day foray exploring other regions. No plans have been made, so for the sake of this ballot please indicate your preference assuming that where, when and cost will be resolved to your satisfaction.

Dues

Members are reminded that the 1975 membership dues are due January 1, 1975.

Individual Membership \$ 5.0 Family Membership \$ 7.0

Please make checks payable to the Lakeland Mycology Club and mail it and the enclosed proxy to

Mrs. Margarete Turchick

<u>Comments on Books</u> by Candace Wiser

Many of us are familiar with the large format, slender books of color photographs printed in Italy. Mushrooms and Toadstools by Uberto Tosco (Crescent Books) is one of these. Now another such volume by Tosco is available. It is The World of Mushrooms (Bounty Books \$4.95). Both these books are apparently adapted from his \overline{I} Funghi (about which I have no information) but the newer, larger volume is much the better of the two. This is a coffee table volume for browsing rather than a reference book. The organization into sections is somewhat unscientific but the illustrations are arranged for maximum information at a glance. And the illustrations are superb - color photographs and lovely water colors. Unfortunately the text and even the captions are a little hard to fit to the illustrations.

The book has a feature I have not encountered elsewhere and liked very much - the Index of fungi, both latin and common names, is in the front of the book.

Mrs. Margarete Turchick

Dear Mrs. Turchick,

I will be unable to attend the General Membership Meeting January 12, 1975 and request that you submit this proxy on those matters discussed in the December Newsletter.

December Newsletter.

NJMA FORAY GUIDE

Unless otherwise noted in the newsletter, we will meet at the designated Foray area at 10:00 A.M. Groups will be formed and started by 10:15 A.M.

2. Forays will be held Rain or Shine and may be on rough trails or through woods.

Dress accordingly.

It is the responsibility of each mushroom hunter to remain with the group.

The Foray Leader is responsible for the conduct of the Foray and the cooperation

of members and guests is expected.

- Collection: Paper bags or waxed paper, a knife and a basket are essential. DO NOT USE PLASTIC BAGS OR PLASTIC WRAP. The results of storing fleshy fungi in plastic are humiliating. Try to get specimens of the same species in various stages of development. Use a knife to dig up the entire specimen, including those parts below the surface of the substrate. Do not mix different species in the same bag. Field check lists will be available and members are encouraged to use them.
- 6. Specimens belong solely to the finder. However-when mushrooms of particular interest are located, please allow others to examine and photograph them in situ. Disposition of the specimen is the prerogative of the owner, but cooperation with the Taxonomy Group is urged for the benefit of the entire membership.

7. The morning foray will continue until 12:30 P.M. at which time a lunch break

will be taken at a picnic area designated by the foray leader.

8. After lunch, the Education Committee will have instructors available for brief discussions of various aspects of mycology-with particular emphasis on the

morning's collection.

9. Identification. Three tables will be set aside for the sorting, identification and display of fungi collected. Members are invited to place any specimens collected during the Foray on the Sorting Table. Plates and collection forms will be available. Only specimens with collection forms will be transferred to the Identification table where members of the Taxonomy Group will be available to work with them. Specimens whose identity is verified will then be placed on the Display table for general examination.

10. In connection with the Taxony Group's efforts to develop a New Jersey Mycological Herbarium it is necessary that one good specimen of every species collected at each foray-with field notes-be made available to the club. The cooperation of

the general membership is essential for the success of this project.

11. Afternoon forays may be formed for those interested members.

12. Members are encouraged to bring friends who may be interested in our programs

to any club function.

Collectors are urged to use good conservation practices and to endeavor to leave 13. foray areas as undisturbed as possible. If fungi populations are repeatedly decimated by over-zealous collectors, future years will see decreases in the size and variety of the fungi flora of the area. Please think ahead!

14. Suggestions are welcome. Please advise the foray leader or any club officer.

15. WARNING: Never eat anything which has not been positively identified, and known to be edible. Poisonous mushrooms can be fatal. While Foray Leaders and others may aid in classification, neither the Association nor the individual members are responsible for the identication of any fungus.
